User Stories and User Characteristics

CYBERNAUTS

User Characteristics

Developer

Developers are the primary users of the system. They work on projects and need to track their time daily. They can log time manually or use the timer for automatic tracking. Draft timesheets are flexible: developers can edit, delete, or adjust them before submission.

To ensure accuracy, the system compares their logged hours against external data sources, Jira tickets show estimated versus actual time, Google Calendar tracks meeting duration, and GitHub commits reflect coding effort. They also make use of AI suggestions to improve productivity. Furthermore accuracy matters to them, they want their logged hours to be precise and correct.

Manager

Managers oversee teams and projects. They can create workspaces and monitor how time is being spent. Their main job is to review and approve or reject timesheets submitted by developers. They don't look at every single time entry. Instead, they rely on dashboards, reports, and AI-generated summaries to spot issues like burnout, underutilisation or task anomalies. They also manage team availability such as leave requests, and make sure project budgets stay on track. Managers receive notifications in grouped summaries, not constant alerts.

Administrator

Admins have the highest level of control in the system. They don't focus on reporting instead they focus on keeping the system running properly. They manage user accounts, assign roles, and enforce security policies like access control. They set up integrations with external tools like Jira, GitHub, and Google Calendar. They also handle project setup, archiving, and lifecycle management. Admins monitor audit logs for compliance, schedule automated report exports, and ensure data integrity and system security.

User Stories

Epic 1: User Authentication & Access Control

- As an employee, I want to register and log in with my company email so my timesheets are tied to my profile.
 - **Acceptance Criteria:** User can successfully create an account using a valid company email domain. The system prevents registration with non-company emails.
- As an admin, I want to assign roles (Developer, Manager, Admin) so each user only sees what they need.
 - **Acceptance Criteria:** Admins can view a list of users and change their role from a dropdown. UI dynamically updates based on the assigned role.
- As an admin, I want MFA enabled so timesheet data stays secure.
 - **Acceptance Criteria:** After entering the password, users are prompted to enter a code from an authenticator app. Invalid codes prevent login.
- As an employee, I want to stay logged in on trusted devices so I don't sign in every day.
 - **Acceptance Criteria:** A 'Remember Me' checkbox keeps the session active for 30 days unless the user manually logs out.

Epic 2: Timesheet Entry & Management

- As an employee, I want to log time manually against a project so my hours are tracked.

- **Acceptance Criteria:** Users can select a project, enter a date, add a duration, and save. The entry immediately appears in the current week's view.
- As an employee, I want to start and stop a timer to track time in real-time.
 - **Acceptance Criteria:** A visible timer can be started and stopped. Stopping it automatically creates a time entry for the elapsed duration.
- As an employee, I want to edit or delete time entries so I can fix mistakes before submission.
 - **Acceptance Criteria:** Draft entries have 'Edit' and 'Delete' buttons. Submitted timesheets cannot be edited.
- As an employee, I want to submit my weekly timesheet for approval so payroll is processed.
 - **Acceptance Criteria:** A 'Submit' button changes the timesheet status to 'Pending Approval' and locks it from further edits.
- As a manager, I want to approve or reject timesheets with a comment so employees know what to fix.
 - **Acceptance Criteria:** Managers see a queue of pending timesheets. Rejecting requires a mandatory comment. Approving changes the status to 'Approved'.
- As an employee, I want to duplicate last week's timesheet as a template to save time.
 - **Acceptance Criteria:** A 'Copy Last Week' button populates the current empty timesheet with the same projects from the previous week.
- As an employee, I want to log time in 15-minute increments for precision.

- **Acceptance Criteria:** Time entry fields only accept values rounded to 0.25, 0.50, 0.75, or whole hours. Invalid entries show a validation error.

Epic 3: AI Productivity & Insights

- As a manager, I want an AI-generated weekly summary of my team's productivity to spot trends fast.
 - **Acceptance Criteria:** A text-based summary is generated every Monday morning, highlighting top performers and potential bottlenecks.
- As an employee, I want to see my productivity score based on billable vs non-billable hours.
 - **Acceptance Criteria:** A visual gauge chart displays the ratio of billable to non-billable hours on the employee dashboard.
- As an executive, I want AI to forecast project timelines based on current and previous team velocity.
 - **Acceptance Criteria:** Project detail pages show an 'AI Estimated Completion Date' that recalculates weekly based on logged vs estimated hours.
- As a manager, I want AI to note idle time patterns across the team to spot gaps.
 - **Acceptance Criteria:** An Insights report identifies specific days or times where the team consistently logs lower activity.
- As an executive, I want AI-generated monthly narratives about team performance for board reports.
 - **Acceptance Criteria:** A 'Generate Report' button compiles key metrics and AI-written paragraphs into a downloadable format.

Epic 4: Leave & Absence Integration

- As an employee, I want to log leave (sick, annual, study) in my timesheet so hours balance correctly.
 - **Acceptance Criteria:** 'Leave' acts as a selectable project, with sub-categories for sick, annual, and study. These hours count toward the 40-hour week but not toward billable utilisation.
- As a manager, I want to see which team members are on leave this week for resource planning.
 - **Acceptance Criteria:** The manager dashboard displays a 'Team Availability' widget showing approved leave for the current week.
- As an employee, I want the AI to automatically mark public holidays in my timesheet.
 - **Acceptance Criteria:** Timesheets spanning a regional public holiday automatically populate an 8-hour 'Public Holiday' entry for that day.
